

# FINAL PROJECT

## CONCEPT ONE

### *Ocean Currents and Weather*

*Ocean currents have a huge impact on our weather. If not for the ocean currents, the global climate would be similar to an ice age. Every three to seven years there is a weather phenomenon called El Niño, which is caused by a shift in ocean currents.*

*JD Stephenson April 17, 2017*

## CONCEPT two

### Mountain Ranges

*In the U.S. the Rocky Mountains mark the continental divide. The presence of a large mountain range can have a big effect on seasonal weather patterns. Also, the weather and climate on one side of a mountain range may be very different from weather and climate on the other side of the range. In the case of the Rocky Mountains, the western slope and eastern slope each have very different climates and seasonal weather patterns.*
